Industrial AI perception modules that Integrators can ship and support.

We deliver Vision Inspection, Robot Guidance, and Identification & Verification — packaged for commissioning, acceptance, monitored performance, and governed updates.

Cameras / Sensors → **Keplore AI (Edge Deployable)** → PLC / Robot / Line Logic

Works in your specific setup

— Custom parts, lighting, fixtures, throughput

— Constrained viewpoints and variable conditions

— Validated to your acceptance criteria

Commissioning-ready packaging

— Acceptance criteria defined upfront

— Validation harness + evidence pack included

— FAT / SAT documentation that holds up

Stays reliable over time

— Monitored performance indicators

— Governed updates — you approve every change

— Regression testing + rollback built in

PRODUCTION AI MODULES

Productized modules, deployable across cells and lines.

Each module ships with the same commissioning-ready package — listed below.

Vision Inspection

SCOPE

— Defect detection + measurement

— Surface, dimensional, and cosmetic checks

— Variable lighting and mixed SKUs

OUTPUT CONTRACT

Structured pass/fail with defect classification, location, and measurement — plus explicit unknown handling below threshold.

Robot Guidance

SCOPE

— Pick, place, insertion, and alignment

— Variable fixtures and lighting conditions

— No hand-tuning per configuration

OUTPUT CONTRACT

Target position and pose with confidence score — plus defined low-confidence behaviors: re-acquire, retry, hold, divert.

Identification & Verification

SCOPE

— Label, logo, mark, and count verification

— Character ambiguity and partial occlusion

— Industrial packaging and logistics

OUTPUT CONTRACT

ID and verify outputs with confidence score — NO_READ signaling, re-read triggering, and exception hooks for routing logic.

EVERY MODULE INCLUDES

· Acceptance criteria + evidence pack · Interface spec + validation harness · Update-ready regression suite · Versioned releases + rollback · Runbook + rollback procedure

What stays yours: PLC / robot programming · safety · commissioning · cell architecture · customer relationship

WHERE KEPLORE PLUGS IN

Where Keplore plugs in.

A module, not a rip-and-replace. Your controls and architecture stay intact.

Cameras / Sensors → **Keplore AI Module (Edge Deployable)** → PLC / Robot / Line Logic

Clean boundary

We output control-ready results — coordinates, classifications, pass/fail with confidence. Your PLC, robot, or line logic consumes them directly without modification.

What stays yours

Robot and PLC programming, safety, commissioning, cell architecture, and customer ownership. Keplore touches none of it.

How it ships

Edge deployable package with acceptance criteria, validation artifacts, update-ready regression, and rollback — ready for FAT/SAT hand-off.

Designed to drop into integrator workflows without changing your standard stack.

WHY INTEGRATORS USE KEPLORE

Why integrators use Keplore.

Reduce delivery risk now, reduce support burden later, attach software value without platform battles.

01

Protect the schedule

- Fewer late-cycle surprises at FAT / SAT
- Acceptance criteria + interfaces defined early — before build starts
- Integration-ready packaging reduces rework at handoff

02

Reduce support burden

- Monitored performance indicators after go-live
- Governed updates — you approve, regression-tested, rollback-ready
- Fewer fire drills when conditions change on site

03

Expand your job scope

- Take on higher-variance perception jobs with less tuning load
- Repeatable modules + playbook across cells and lines
- Attach a recurring software SKU without owning a platform

Fast fit check: 15–20 minutes to see if we can help on your next perception-heavy job.

DELIVERY PLAYBOOK

Same five steps, same outputs, every engagement.

A repeatable delivery structure with defined artifacts at every gate.

01

Define acceptance

Success criteria, thresholds, failure modes, unknown rules.

Output:

Acceptance criteria document — reviewed and approved before build starts

02

Data + edge plan

Coverage for production scenarios and edge cases.

Output:

Capture plan + labeling guide

03

Baseline + risks

Early performance report plus top failure modes identified.

Output:

Baseline report + risk list

04

Integrate + validate early

Interface spec and validation harness delivered so your team can integrate and validate while we tune.

Output:

Interface spec + validation harness

05

Ship the package

Acceptance pack for FAT/SAT plus an update-ready validation pipeline — regression, evidence, rollback.

Output:

Deployment-ready module package

Every step closes with a reviewed artifact. No milestone closes without sign-off.

DELIVERABLES

A module you can commission, hand off, support.

Every engagement delivers the same artifact set, regardless of module type.

- ✓ Module package (edge deployable)
- ✓ Interface spec
- ✓ Acceptance criteria document
- ✓ Validation harness (integration + test)
- ✓ Update-ready regression suite
- ✓ Validation / evidence report
- ✓ Release notes + version log
- ✓ Runbook + rollback procedure

FAT / SAT — defined once

Acceptance criteria defined before build starts. FAT validates against those criteria before handoff. SAT validates the same criteria at the customer's site — same document, same thresholds.

Change requests

Anything outside the original acceptance criteria scope is a defined change request — scoped and agreed before work starts. No scope creep by default.

Post go-live

Governed update service. Drift detection is continuous. Updates are proposed, not automatic. Response SLA defined at engagement start.

This package keeps scope bounded, acceptance clean, and updates manageable after go-live.

REPRESENTATIVE EXAMPLES

Two examples, same modules, same playbook.

Both delivered using the modules and playbook shown in prior slides.

Inspection module running in an active manufacturing line

→ Defect detection + measurement in a high-volume environment

→ Acceptance criteria + validation / evidence pack delivered at go-live

→ Update-ready regression + governed releases in place (with rollback)

→ Multi-site deployment — single governed release process across all locations

→ FAT and SAT both validated against the same acceptance criteria document

Guidance module for a high-repeatability insertion workcell

→ Target acquisition under production lighting variation

→ Coordinate / pose outputs with confidence to the robot controller

→ Low-confidence behaviors to prevent silent misses — retry / hold / divert

→ Closed-loop verification logged per cycle

→ Validation harness + acceptance criteria included in delivery package

Representative examples of the same modules and playbook — not one-off builds. Additional detail shared on request.

AFTER GO-LIVE

Maintained under control, not handed off and forgotten.

When conditions change — new SKU, lighting shift, fixture tolerance drift — the system surfaces it, proposes a candidate update, then verifies it before release.

Update-ready validation pipeline

Proposed updates are verified against regression coverage and packaged with evidence before release.

Reversible

Staged deployment with rollback. If a version underperforms, you can revert quickly with a full audit trail.

Explicit sign-off

Nothing changes in production without your authorization. The system proposes. You decide. Every engagement.

This is not autonomous. Every change is governed, documented, and reversible. Your customer can ask what changed and why — and you will have the answer.

20 minutes. Bring your upcoming projects.

If any of your upcoming jobs have a perception problem — inspection, robot guidance, or ID and verification — let's find out in 20 minutes whether we're a fit. We will tell you what we can deliver, what the interface looks like, and when — in writing, before any commitment.

In the call, we will:

1. **Identify where perception is the schedule risk**
   We listen for where vision or guidance is the delivery or rework exposure on your specific job.
2. **Define outputs and interfaces — in writing**
   What the module delivers, what format, what confidence behavior — written before any commitment.
3. **Confirm acceptance approach and delivery plan**
   Whether the acceptance approach fits your timeline. Scope estimate before any engagement starts.

Not ready for a call?

Send 10–30 representative images or a short clip from the application, plus your success criteria if available.

We will return a feasibility readout and a proposed output spec.

No commitment required.
